Laser Pointer Information

A laser pointer is a small portable device with a power source and a laser diode. A laser pointer emits a very narrow low-powered laser beam of light. The small beam width makes the beam itself virtually invisible; only showing a point of light when meeting an opaque surface.

Choosing Your Laser Pointer Light Color

Green

Far brighter than red lasers, green laser beams can be visible for thousands of feet in optimal conditions making them more than capable of handling meeting-room pointing jobs. Green laser light seems brighter than other colors because the human eye is most sensitive at low light levels in the green region of the spectrum (wavelength 520–570 nm). Green laser pointers are ideal for use during presentations which require the use of projection screens and monitors, bright lighting, or rear projection.

Red

The most obvious difference between green and red laser pointers is beam visibility. The human eye perceives green laser light to be roughly 50 times brighter than red lasers and red lasers lack the power and distance of green lasers.

The other main difference between red and green lasers is the complexity of their construction. Red lasers are the simplest pointers, smaller and generally much more affordable than lasers of other colors. Red lasers make an effective presentation tool and are commonly used throughout schools and offices.

Laser Classes

Class 2:

<1 mW Power; approved for most classroom and office use. A Class 2 laser is safe because the blink reflex limits the exposure to no more than 0.25 seconds. It only applies to visible-light lasers (400–700 nm). Class-2 lasers are limited to 1 mW continuous wave. Intentional suppression of the blink reflex could lead to eye injury.

Class 3a:

<5mW Power; general purpose pointer. Lasers in this class are considered safe when handled carefully. Beam power density may not exceed 2.5 mW/square cm if the device is not labeled with a "caution" warning label, otherwise a "danger" warning label is required.
